

Bioenergy

HEAT Bioenergy is a specialist in the development, planning and construction of biogas plants. The growing pollution of our environment, the increasing amounts of organic waste from catering, tourism, food industry and trade increase the demand for environmentally friendly disposal routes.

With the efficient use of bio- waste and renewable resources HEAT not only has developed renewable energy (heat and/ or energy), but also implemented sustainable the fermentation processes. This development of biogas plants for industrial applications has been our goal and is our mission at the same time.
